#### **Defects liability**

Bamburi Special Products provide block-laying services for Bamburibox concrete paving. A defects liability period of one year is provided on our laying services.

### **Maintenance advice**

Bamburi Special Products offers its customers free maintenance tips.

### **Re-sanding**

Jointing sand is lost in the early stages of pavement life due to wind, rain, traffic and termites. It is therefore, advisable that pavements are inspected and re-sanded at regular intervals.

In areas where there's a likelihood of termites attack it is recommended that insecticides be sprayed before paving commence.

### **Weed growth**

Weeds occasionally grow in the joints between blocks as a result of windblown seeds. If there is any chance of having weeds its recommended that herbicides should be mixed into the bedding and jointing sands or sprayed onto the finished paving.

### **Efflorescence "let nature take its course"**

Efflorescence is white deposit, which is apparent either as white particles or as an overall lightening in colour. It's highly recommended that efflorescence be allowed to disappear

naturally to avoid damage by an acid wash.

### **Oil stains**

Oil stains should be scrubbed with a hard bristle brush and a strong detergent to wash off with water. In areas where oil stains are obvious such as on a garage forecourt. It is advisable that coloured blocks are used to reduce visibility of the stains.

### **Abrasion**

Abrasion occurs when paved blocks have been subjected to intense trafficking. Since it does not affect the structural integrity of the paving there is no alarm, provided the blocks of adequate strength. The degree of abrasion diminishes with time.
